

## OREZONE ANNOUNCES RECENT DRILLING RESULTS AT BOMBORÉ PROJECT

September 12, 2017 – Orezone Gold Corporation (“Orezone” or the “Company”) (TSXV:ORE) is pleased to report recent Reverse Circulation (“RC”) drilling results from the first two of four specifically identified target areas (See Press Release of June 22<sup>nd</sup> 2017) that have been prioritized within the Bomboré deposit to better define the extent and the geometry of discrete zones of high-grade gold mineralization within the oxidized portion of the known gold resources.

The drilling at both Siga East and Siga South has been very successful in intercepting high grade mineralization which should improve grade domaining. More drilling will be required in certain areas to confirm the geometry of discrete higher grade zones.

### Highlights from Siga East and Siga South (true width has yet to be determined):

- BBC4505: from 6 to 11m: 5m @ 3.176 gpt, incl. 1m @ 12.7 gpt;
- BBC4506: from 40 to 55m: 15m @ 7.541 gpt, incl. 8m @ 13.2 gpt;
- BBC4523: from 18 to 34m: 16m @ 1.675 gpt, incl. 1m @ 8.5 gpt; and  
from 41 to 43m: 2m @ 7.816 gpt, incl. 1m @ 14.7 gpt;
- BBC4534: from 54 to 56m: 2m @ 7.343 gpt, incl. 1m @ 14.2 gpt;
- BBC4547: from 28 to 39m: 11m @ 2.372 gpt, incl. 2m @ 6.2 gpt;
- BBC4555: from 56 to 63m: 7m @ 2.107 gpt, incl. 1m @ 6.1 gpt;
- BBC4556: from 31 to 32 m: 1m @ 9.603 gpt;

Patrick Downey President and CEO stated “We are extremely pleased with these drill results. We are now convinced that the specifically targeted areas can be discretely modelled within the main zone which should have a positive impact on the continued development of the project and we look forward to the ongoing drill results from the P11 and CFU zones.”

The RC drilling programme commenced on July 8, 2017 and was designed as essentially infill holes to tighten up the drill spacing from 50 m by 25 m to 25 m by 25 m in the four specific target areas. To date 187 drill holes totalling approximately 9,400m have been completed at Siga East and Siga South. The drilling is ongoing with 4,500 m of RC drilling planned on the P11 and CFU target areas and these results are expected to be released early in Q4 2017. Another 3,000 m should also be completed on sites that were skipped pending the end of the rainy season and others that warrant follow-up drilling or where more drilling should better confirm the geometry of the high-grade zones.

The mineralized intervals are based on a lower cut-off grade of 0.45 g/t, a minimal width of 2 m and up to a maximum of 1.5 m of dilution being included. The true width of the mineralization is approximately 90% of the drill length at Siga South and Siga East. The RC drilling samples were divided by Orezone employees using Rotary Sample Dividers (RSDs). A 2-kg split was prepared by SGS Burkina Faso s.a.r.l. at the Bomboré sample preparation facility and then split by Orezone to 1 kg using Rotary Sample Dividers (RSDs). A 1-kg aliquot was analyzed for leachable gold at BIGS Global Burkina s.a.r.l. in Ouagadougou, by bottle-roll cyanidation using a LeachWell™ catalyst. The leach residues from all samples with a leach grade in excess of 0.2 g/t were prepared by BIGS Global Burkina s.a.r.l. and then split by Orezone to 50 g using Rotary Sample Dividers (RSDs). A 50 g aliquot was analyzed by fire assay at SGS Burkina Faso s.a.r.l. The composite width and grade include the final leach residue assay results for most of the drill intercepts reported; leach residue assays are pending for 29 RC holes. Orezone employs a rigorous Quality Control Program (QCP) including a minimum of 10% standards, blanks and duplicates. A complete list of assay results from the current RC drilling programme can be found on the Company's website at the following link ([Drill Results](#)).
